Agromet Advisory

Main field preparation for transplanting.

Transplant two seedlings per hill in erect & shallow position at a spacing of 15 cm x 10 cm. Apply 20-40-40 kg N- P₂O₅- K₂O/ha fertilizer at final puddling. Ensure 70 hills/sq m (15 cm x 10 cm spacing) for higher yield. Maintain only a thin film of water at the time of transplanting. Keep alley ways for controlling BPH (30 cm gap after every 10 rows). For weed control apply Butachlor @ 3lit/ha within 2 days after transplanting.

Oilseeds

Due to increasing temp., go for sowing of oilseeds, which will result good germination. To control powdery mildew in mustard, apply 1 kg sulphur per acre. Apply irrigation in Sunflower in flowering stage for better yield.
